

Updates on the National Radiation Bioassay Program at CDC

Robert L. Jones, PhD

Inorganic and Radiation Analytical Toxicology Branch

June 2, 2014

APHL 2104 National Meeting

Disclosure

Mention of company or product names does not constitute endorsement by the National Center for Environmental Health (NCEH), Centers for Disease Control (CDC), or the Public Health Service.

Potential Radiological or Nuclear Incidents

• Nuclear

- Damaged nuclear facility
- Improvised nuclear device
- Nuclear weapon

• Radiological

- Radiological dispersion device (RDD);
e.g., “Dirty bomb”

Radiation Diagnostics

- Radiation **Exposure**: A person is “exposed” to radioactive materials through
 - gamma irradiation (external only e.g. IND blast)
 - “exposure” to alpha, beta or gamma radiation from external or internal contamination (RDD or IND fallout).
- Radiation **Contamination**: A person is “contaminated” internally with radioactive materials via inhalation or ingestion.

Both “exposure” and “contamination” results in an exposure dose.

The Boston Marathon 2013

What if,

It had been an RDD

(“Dirty Bomb”)?

Dispersal Pattern

-  Fireball Interaction Area (< 100 μm , about 5% of material in fireball)
-  Large Particles ($\approx 100 - 500 \mu\text{m}$)
-  Ballistic Fragments (> 1 cm)
-  Downwind Fallout (small particles)

Was it a Widespread Dispersal?

Examples of Mass Screening/Analysis

- 1987 Goiania – ^{137}Cs - **112,000** tests
- 1995-1996 U.S. Methyl parathion – **16,000** tests
- 2001-2002 U.S. Anthrax (clinical) - **250,000** tests
- 2001-2002 U.S. Anthrax (environmental) – **1,000,000**
- 2005 NV Mercury exposure – **280** tested
- 2006 London - ^{210}Po - **800** tested

Concerned Citizen Multiplier

- 1987 Goiania – ^{137}Cs – 50 treated / 112,000 tested = **2240 “concerned citizen multiplier” (CCM)**
- 1995-1996 U.S. Methyl parathion – **16,000 CCM**
- 2001-2002 U.S. Anthrax (clinical) – 30 casualties or infected / 250,000 tests = **8,500 CCM**
- 2005 NV Mercury exposure – 1 contaminated / 280 tested = **280 CCM**
- 2006 London - ^{210}Po – 1 casualty / 800 tested = **800**

CCM

CDC Guidance on Population Monitoring

- **Target audience:**
 - State and local public health and emergency preparedness personnel
- **Focus:**
 - Terrorism incidents involving mass casualties
- **Scope:**
 - Assumes local infrastructure is intact
 - Principles apply to all radiation incidents
- **Updated April 2014**

Population Monitoring in Radiation Emergencies

A Guide for State and Local Public Health Planners

Second Edition

April 2014

National Center for Environmental Health
Division of Environmental Hazards and Health Effects

Bioassay: Key Issue

Detection of Internal Contamination

Radionuclides	Urine bioassay detection	Primary radiation detection
Uranium (^{235}U , ^{238}U), Thorium	yes	alpha and beta
Strontium, Plutonium (^{238}Pu , ^{239}Pu)	yes	
Americium, Californium, Neptunium,	yes	
Phosphorus, Curium, Polonium	yes	
Cesium, Cobalt (^{57}Co , ^{60}Co), Radium	yes	Gamma rays
Iodine (^{125}I , ^{131}I), Technetium-99m	yes	
Selenium, Molybdenum, Iridium	yes	

Internal radiation screening via hand held detectors or portals is only applicable for gamma emitting radionuclides.

Examples of Contamination Triage

Testing for **Alpha** Emitters

External Testing:
Alpha/Beta/Gamma
Emitters
Pre-Decon

External
(Alpha/Beta/Gamma)
Internal
(Gamma only)
Testing:
Post-Decon

External
(Alpha/Beta/Gamma)
Testing

External/Internal
(Gamma only)
Testing

e.g. 100,000 Samples

Screen for any radionuclide and Prioritize

Gamma Spectrometry
Quantification

Alpha Spectrometry
Quantification

Mass Spectroscopy
Quantification

High Resolution Mass
Spectroscopy Quantification

Identification and Quantification

e.g. 1,000 to 10,000 Samples

CDC Radiation Lab Updates

Analytical methods for 14 of the 22 Priority radionuclides have been developed

Refining and enhancing current methods
(e.g. Sr-90, Pu-239)

Additional methods being developed for:

Np-237 via Q-ICP-MS

Ra-226 via HR-ICP-MS

Se-75 via Gamma Spec. (HPGe)

Po-210 via Alpha Spec

CDC Radiation Lab Updates

Automation for NaI Gamma Spec method:

425 - 10mL vials

Automation for HPGe Autosamplers:

100 - 10mL vials (well detector)

49 - 50mL urine cups (coaxial detector)

HPGe Detector LODs

Detector Type	Co-57	Cs-137	Co-60	Ir-192
Small Coaxial*	36	35	41	66
Large Coaxial*	44	28	28	58
Well**	31	16	17	59

All LODs are in Bq/L

10 mL geometries: * 10mL in a 120mL urine cup

** 10mL in a 15mL tube

Small = ~85%, Large = ~180%, Well ~ 130% relative efficiency (based on size)

Small: 330cc, Large: 730cc, Well: 520 cc (with 4 pi collection geometry) 17

Information for Professionals

- The Nuclear Radiological Incident Annex (a part of the National Response Framework) outlines the response activities for a radiation emergency.
- Public Health Professionals will conduct population monitoring operations (identifying people contaminated with radioactive materials or exposed to radiation).
- Managing medical surge in a radiation emergency will include facility preparation, surge capacity, health care provider safety, patient decontamination, triage and the medical management of life threatening injuries. The **Radiation Emergency Medical Management (REMM) website** provides clinicians with information on medical management of radiation injuries.
- Radiation emergency preparation and response guidance is a reflection of the CDC's Public Health Preparedness **Capabilities** standards.

Radiological Incident Impact

- Loss of life
- Acute radiation exposure
- Potential future cancer risk
- Psychosocial issues
- Economic impact, including area denial (due to contamination)
- Increased anxiety among citizens

Summary

- Radiation Laboratory Methods (bioassay): rapidly identify and quantify specific radionuclides in people potentially contaminated in a radiological or nuclear event.
- Provides critical information for **effective** medical management of individuals by **assessing risk** for medical management and **follow-up**
- Provides information for population monitoring (populations and population sub-groups)
- Provides “**negative**” results for people who think that they may be contaminated, but, are not truly contaminated.

What can you do to be prepared and respond to a radiological incident?

- ❑ Be prepared for a radiological or nuclear incident with pre-planning
- ❑ People's contamination to radionuclides (or radiation) can be minimized (time, distance, shielding, PPE, etc.)
- ❑ People's external contamination can be reduced via decontamination procedures
- ❑ People's contamination can be rapidly evaluated for external and internal contamination
- ❑ Medical management guidelines and some medical countermeasures for the treatment of internal contamination of people are available for the medical community to use
- ❑ Prepare for the people's psychosocial and anxiety issues
- ❑ Have a communications plan

Radiation Diagnostics

- **Biodosimetry**: Use of clinical and laboratory observations to estimate radiation dose received after radiation exposure. (**BARDA method R&D**) *Most effective for estimating injury due to irradiation [shine] (IND, RED or NPP).*
- **Bioassay**: Any procedure used to determine the nature, location or retention of radionuclides in the body (*contamination*) by direct (*in vivo*) measurement or by indirect (*in vitro*) analysis of material excreted or otherwise removed from the body (CDC methods). Generally used for the purpose of estimating intake and committed dose. *Most effective for estimating injury due to inhalation or ingestion after a RDD, IND or NPP fallout.*

Rapid Radionuclide Bioassay analytical methods: traditional versus new methods

“Traditional” Radionuclide methods: DOE

New “Rapid” methods: CDC

	“Traditional” Radionuclide methods: DOE	New “Rapid” methods: CDC
Time to first analytical results for 40 samples	About 3-6 <i>days</i>	Less than 24 hours
Sample Requirements	24 hour collection	“ <i>spot</i> ” collection
Sample Size Requirement	1 -2 L	70 mL
Number of radionuclides with validated clinical methods	Limited to contract with DOE Bioassay lab	22 + “fission products” (14 current)
Sample throughput	10-20 samples per day	250 -3000 samples per day
CLIA Certified Methods	no	yes
Scalable for “Surge Capacity”	minimal	yes
